Creating Quality Software For The Manufactured Housing Industry.

Installing Sales System Correctly on a Windows 7 (Or Vista) Computer for the first time.

- Step 1) Run The Base Installation (as administrator). This installs the basic windows controls and dlls and registers them in the correct directories.
- Step 2) Run the update program (as administrator). You can download this from the support site on www.jfsoft.net. This program will download all the latest updates and dlls from our servers and make sure that all the correct directories have been set up.
- Step 3) Once the update program has completed it will attempt to start the Sales Management System and it will ask for the SQL Server Password and SQL User ID. (These are different than the Security users and passwords in the Sales System) This information is so the Sales Management System can connect to the SQL Server Database.
- Step 4) After you have entered the Password and User ID the system should fail with a "Can not Connect to Database Error" Because the database information has not been entered yet. Open the Database Paths program and set the important information.
- Step 5) Download the Print Preview Setup Program to your local drive and extract the contents to a local directory. Don't allow it to run the setup from the internet. Instead go into the local directory you extracted the contents to and Run the "prtSetup.exe" program as an administrator. Follow the directions. Once that has been completed, you will need to set up the SMS Virtual Printer (Print Preview Printer). Extract the "Tektronix Phaser 300i" then set up a new printer using the Tektronix Phaser 300i Driver and select the port listed as "[Drive]:\Windows\VirtualP.prn". After this printer has been setup, go into the Database Paths program, Load the Manufacturer information and select printers. Make sure that the print preview printer is setup and ensure that the "Use these printers" is checked and make any other changes to the other printers then press Save.
- Step 6) Run the Sales Management System the first time as administrator to ensure that the system connects successfully to the database.
- Step 7) I recommend a computer reboot to make sure that all the DLLs are registered correctly.
